INTRODUCTION

□ Focus of the study:

Can WiMAX deliver comparable network performance to ADSL broadband access for streaming audio, video applications and simple applications like HTTP, FTP and Email?

WiMAX: Worldwide Interoperability for Microwave Access.
ADSL: Asymmetric Digital Subscriber Line
HTTP : Hyper Text Transfer Protocol
FTP : File Transfer Protocol

INTRODUCTION

□ **What is WiMAX Broadband Access?**

- Worldwide Interoperability for interoperability Microwave Access
 - IEEE 802.16 802.16-2004
 - IEEE 802.16e 802.16e-2005
- All IP network architecture
- Flexible QoS supports voice & video
- Connection oriented bandwidth request / grant scheme
- Optimized for outdoors
- Scalable to 1000's of users
- Point to multipoint mode
- Two types: Fixed, mobile
- Replaces ADSL, T1 line

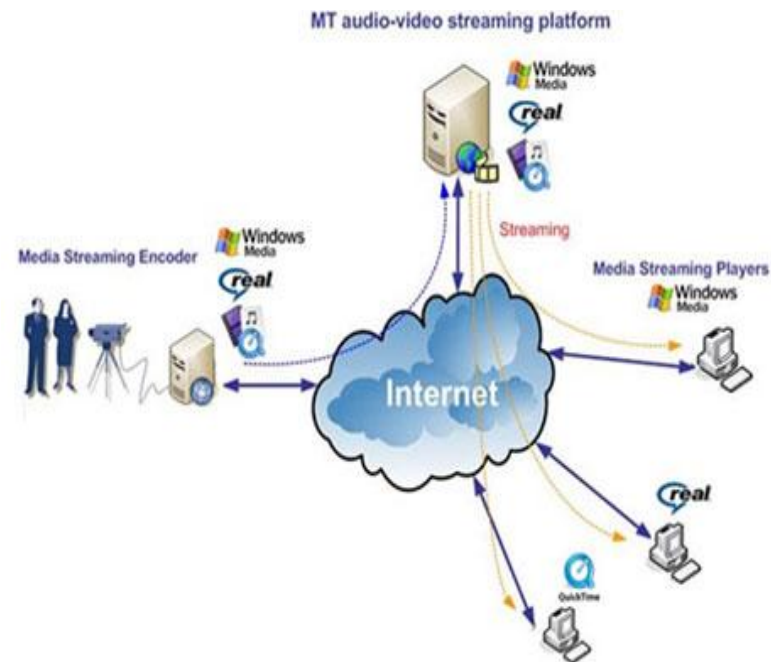

QoS: Quality of Service

T1: Transmission One

INTRODUCTION

□ What Is Audio and Video Streaming?

- Digital audio/video source delivered to clients over an IP network infrastructure
- Digital data information is organized as frames
- Frames are compressed using MPEG-4 codec scheme
- Compressed frames are encapsulated in protocol headers
- Audio/video frame packets are transmitted at a constant rate

INTRODUCTION

❑ **Other Applications:**

- HTTP is the foundation of data communication for World Wide Web and designed to retrieve web pages.
- FTP is designed for transferring files and offers faster overall throughput and better error checking.
- Electronic mail is method of exchanging messages from senders to receivers.

INTRODUCTION

Contribution:

□ Reference Model:

Will Hrudey “**Streaming Video Content over WiMAX Broadband Access**”

- Application: Video only
- OPNET version 14

□ New Model:

- Applications: Video, Audio, HTTP, FTP and Email
- OPNET version 16

ROADMAP

- Introduction
- **Design**
- Validation
- Analysis
- Conclusions
- Challenges
- Future Work
- References

DESIGN

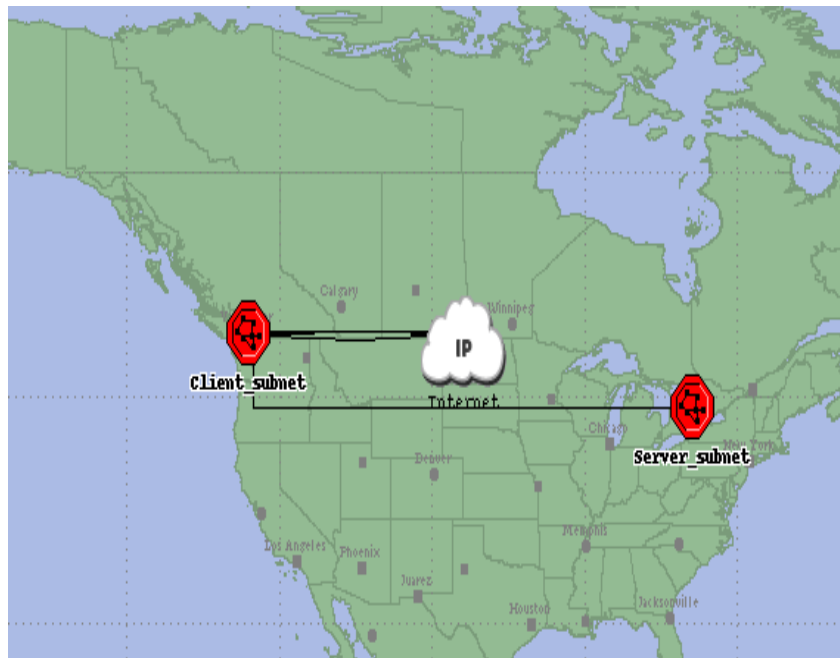

The model is designed for observing the following performance matrices:

- ❑ **Loss** –Number of Packets Dropped
 $1 - (\text{number of received packets}) / (\text{number of expected packets})$
- ❑ **Delay** –Average Time of Transit
Processing delay + propagation delay + queuing delay
- ❑ **Jitter** –Variation in Packet Arrival Time
Actual reception time –expected reception time
- ❑ **Throughput** –Minimum End-to-End Transmission Rate
Measured in bytes / sec (or bps)

DESIGN

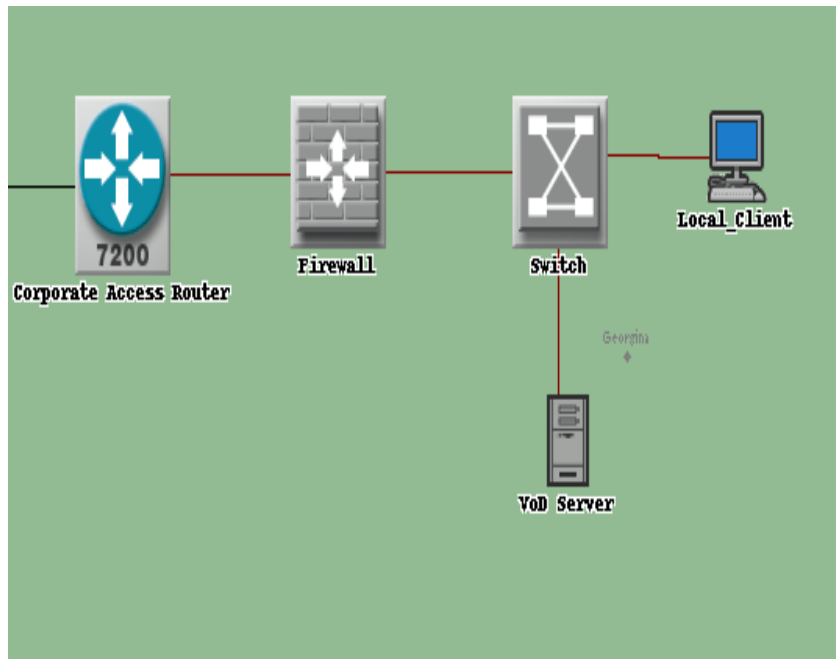

□ Network Topology

- Server subnet located in Toronto
- Client subnet located in Vancouver

DESIGN

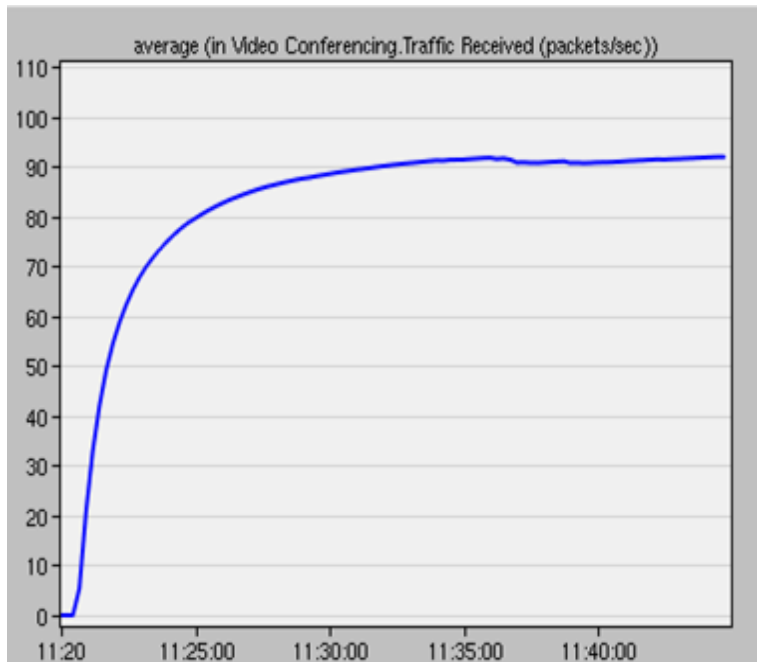

❑ Server Subnet Topology

ROADMAP

- ❑ Introduction
- ❑ Design
- ❑ **Validation**
- ❑ Analysis
- ❑ Conclusions
- ❑ Challenges
- ❑ Future Work
- ❑ References

VALIDATION

Network traffic received (packet/sec) (reference model)

Network traffic received (packet/sec)

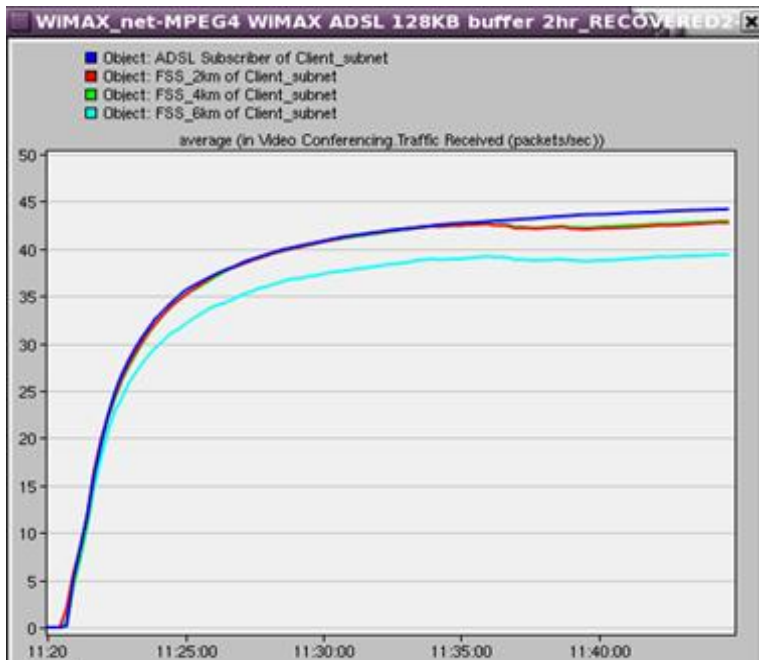

- Compare all performance matrices of reference model with new model.
- Reference model graph shows an average of 90 packet per second, whereas new simulated model shows a significantly high rate of 165 packet per second received.

ROADMAP

- Introduction
- Design
- Validation
- **Analysis**
- Conclusions
- Challenges
- Future Work
- References

ANALYSIS

Packet Loss Measurement (Average)

Traffic received for buffer size 128KB

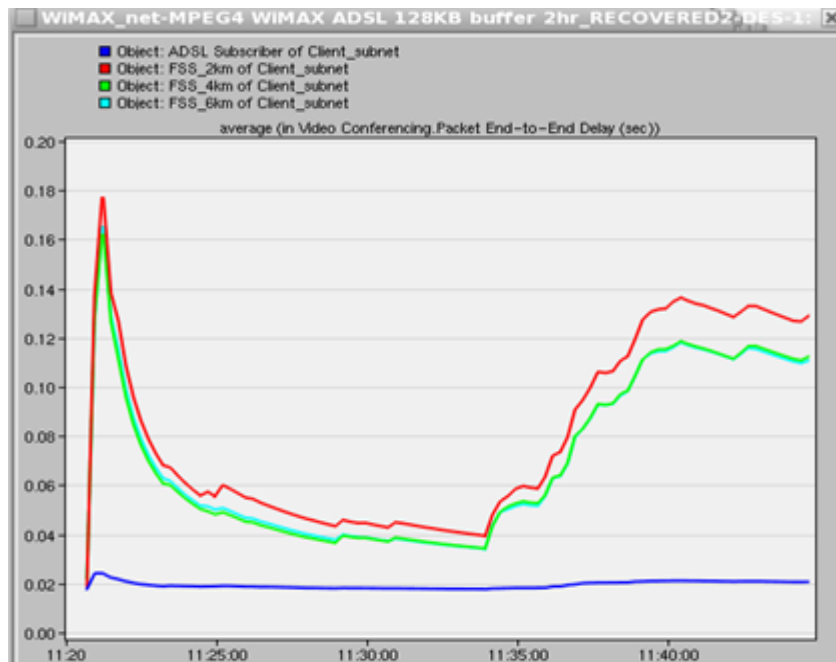

Traffic received for buffer size 1024KB

- WiMAX results depicts loss as deviation from the blue line representing ADSL results for 50pkts/sec
- Buffer size 1024 KB is large enough to reduce number of packets dropped and results for WiMAX become comparable to ADSL results

ANALYSIS

□ Delay Measurement

End-to-end packet delay

- ADSL client curve approaches the ideal delay of 10 ms or less
- WiMAX client station curves are closely tracked each other and approaches the average delay of 60 ms.

ANALYSIS

❑ Jitter Measurement

Video packet jitter

- ADSL client curve performed better than the ideal jitter of 20 ms
- WiMAX client station curves are closely tracked each other and approaches the average jitter of 24 ms

ANALYSIS

Throughput

Minimum throughput

- 2 km WiMAX client curve exhibits better throughput than ADSL client curve
- As distance increases, 4 km and 6 km WiMAX client curves show deviation

ANALYSIS

Throughput comparison of all applications

Throughput comparison of audio/video and other applications like HTTP, FTP, and Email

Throughput comparison of HTTP, FTP, and Email

ROADMAP

- ❑ Introduction
- ❑ Design
- ❑ Validation
- ❑ Analysis
- ❑ **Conclusions**
- ❑ Challenges
- ❑ Future Work
- ❑ References

CONCLUSION

- ❑ Simulation Time : 30 minutes

- ❑ WiMAX satisfies the performance metrics
 - WiMAX packet loss significantly reduced by increasing BS buffering

- ❑ Overall results in comparison to ADSL are promising
 - Dependant on specific carrier deployment parameters WiMAX has the capacity to deliver higher throughput rates and QoS

- ❑ Simulations do not guarantee real world equivalence
 - Must be considered when interpreting results

ROADMAP

- ❑ Introduction
- ❑ Design
- ❑ Validation
- ❑ Analysis
- ❑ Conclusions
- ❑ **Challenges**
- ❑ Future Work
- ❑ References

CHALLENGES

- ❑ Environment (licensing, access)
- ❑ Disk Quota exceeded
- ❑ Learning WiMAX fundamentals within project duration

ROADMAP

- ❑ Introduction
- ❑ Design
- ❑ Validation
- ❑ Analysis
- ❑ Conclusions
- ❑ Challenges
- ❑ **Future Work**
- ❑ References

FUTURE WORK

- ❑ Conduct comprehensive analysis of WiMAX networks and characterize more WiMAX parameters
- ❑ Research and refine all performance matrices
- ❑ Incorporate other applications like remote login and network printer
- ❑ WiMAX mobility and shadowing

ROADMAP
